MVP Ideas

Citizen – Role, MVP, USPs (Mobile app)

Core role

Citizen is the **source of ground reality**: they report issues that the authority converts into structured jobs and tenders to contractors.

Citizen MVP

- Raise complaint (mobile):
  - Quick form: auto-GPS, photo(s), short description.
  - Optional: one-tap voice input → speech-to-text for description.
- See status:
  - "My complaints" list with pipeline:
    - Received → Job Created → In Bidding → Work Awarded → In Progress → Resolved.
  - Show category, severity, approximate ETA.
- Notifications:
  - When:
    - Job is created from their complaint.
    - Contractor is awarded.
    - Work is marked completed (with after photo).

Citizen-facing USPs

- Simple, guided reporting:
  - Auto-location + **AI Auto-Category and Description Engine**:
    - User snaps a photo; AI checks if it looks like a real civic issue (pothole, garbage pile, water leak) and not a random image.
    - Auto-fills category, severity, and a concise complaint description (editable by user).
- Full lifecycle "live-stream" visibility:
  - For each complaint, the citizen sees a real-time progress bar:
    - Assigned → Technician En Route → Work in Progress → Repaired, with mandatory "after" photo before closure.
- Multilingual Voice-to-Ticket AI:
  - Citizen taps a mic, speaks in local language; STT + NLU converts this into a structured, geotagged ticket.
- Gamified Rewards:

    - “Impact Points” for:
        - Reporting issues that get verified and resolved.
        - Upvoting/confirming nearby issues.
    - Points ladder (Bronze/Silver/Gold) and future-ready hooks for real-world rewards.

Authority / Admin – Role, MVP, USPs (Web app)

Core role

Authority is:

- Complaint triage + **job creator**.
- Mini tendering authority:
    - Publishes jobs.
    - Evaluates contractor bids.
    - Awards and monitors work.

Authority MVP

1. Complaint intake

- View incoming complaints:
    - Table with filters; click for photos, description, map pin.
- “Create job from complaint”:
    - One-click button:
        - Job title auto-generated (e.g., “Pothole repair – FC Road near XYZ”).
        - Category and severity from AI.
        - Location and **suggested completion window** (e.g., 24/48/72 hours) based on severity and department SLA.

1. Job listing and bidding

- Jobs board:
    - Status: Open for Bids / Under Review / Awarded / In Progress / Completed.
    - Filters by ward, category, severity.
- Job detail:
    - Shows description, linked complaint(s), map location.
    - List of bids: contractor, quoted amount (or just “bid”), ETA, note.
- Awarding:
    - Select a bid → mark job as Awarded.
    - Auto-notify contractor; auto-update complaint/job status.

1. Work monitoring and closure

- Active jobs view:
  - Track progress updates, photos, notes from contractor.
- Final closure:
  - Check before/after photos.
  - Mark job Completed (or Reopen if citizen disputes – stretch).

Authority-side USPs

- AI-assisted job creation:
  - From messy citizen complaint to **structured work order** in one click:
    - AI infers category, severity, completion target, and a clean job description.
- Transparent micro-tendering:
  - All bids visible in one place.
  - Selection reasoning can be captured ("lowest time", "best rating").
- Unified map "command center":
  - Web map view (Mapbox/Leaflet) showing:
    - Live pins for reported issues (colored by severity/status).
    - Contractor crew locations (last check-in position).
    - Risk zones / predicted hotspots shaded on the map.
  - This is your "one screenshot everyone takes" screen.
- Emergency routing:
  - For Critical issues (e.g., major burst):
    - System auto-identifies nearest contractor/crew by GPS.
    - Pings them (in-app + SMS/email) and suggests immediate assignment.
- Predictive hotspot prevention:
  - Simple analytics on historical complaints:
    - Highlight streets/wards that repeatedly show similar issues.
    - Flag as "High risk: likely future hotspot" on the map dashboard.
- Departmental conflict solver:
  - Detects when:
    - A road-work job and a pipe-repair job are scheduled for roughly the same place/time.
  - Prompts admin to merge or reorder tasks to avoid digging the same road twice.

Contractor – Role, MVP, USPs (Web, mobile-responsive)

Core role

Contractor is the **execution engine**:

- Discovers open municipal jobs.
- Bids with cost/ETA.
- Performs the work with on-site updates.

Contractor MVP

1. Job discovery and bidding
- Dashboard:
    - Tabs: Open Jobs / My Bids / Awarded to Me.
- Open Jobs list:
    - Key info: category, severity, ward, location, description, required timeline.
    - Filters by area, category, severity.
- Place bid:
    - Fields:
        - Proposed amount (optional).
        - Proposed completion time.
        - Short note.
    - Job moves to “Bid Submitted” under My Bids.
1. Post-award execution
- My Jobs:
    - All awarded jobs with current status:
        - Accepted → En Route → Work in Progress → Completed.
- On-site reporting:
    - Upload during/after photos.
    - Add brief notes on fix performed.
- Completion:
    - Mark job Completed → triggers authority review and citizen notification.

Contractor-side USPs

- Single pane of civic work:
    - All municipal jobs + their own bids + awarded jobs in one UI, instead of chaotic calls/WhatsApp.
- Fair, trackable selection:
    - Past bids and awards stored, so contractors can see pattern of selection.
- Reputation and routing:
    - Future-ready score based on:

        - Timeliness (meeting ETAs).
        - Quality (complaints not reopened).
    - This score can feed into:
        - Emergency routing (prefer high-score nearest contractor).
        - Bid ranking for authorities.

Overall end-to-end workflow

1. Citizen reports issue (Mobile):
    - Opens app → taps photo → AI recognizes civic issue, auto-fills category/severity/description → citizen confirms and submits.
    - Optional: uses voice-to-ticket to dictate instead of typing.
2. System ingests complaint:
    - Stores complaint (with geo, media, AI metadata).
    - Shows pin on unified map (status: Received).
3. Authority triages and creates job:
    - Opens complaint list → reviews details on map.
    - Clicks “Create Job”; AI generates structured job fields.
    - Job moves to “Open for Bids”; complaint stage: Job Created / In Bidding.
4. Contractors bid:
    - Contractors see Open Jobs list.
    - They submit bids with ETA and quote.
5. Authority awards job:
    - Reviews bids → selects best candidate (time/cost/reputation).
    - Job status: Awarded; contractor notified; complaint stage: Work Awarded.
6. Emergency routing path (if Critical):
    - When complaint severity is Critical:
        - System suggests nearest high-reputation contractor.
        - Auto-drafts a job and pre-assigns / prioritizes it.
7. Conflict solver & hotspot analytics (background):
    - Periodically scan jobs for same street/time conflicts; prompt admin to merge plans.
    - Update hotspot map layers based on complaint density.
8. Field execution by contractor:
    - Contractor updates job: En route → In progress.
    - Uploads during and after photos.
    - Marks job Completed.
9. Authority verifies and closes:
    - Checks photos & notes.

    - Confirms completion → job Completed; complaint Resolved.
10. Citizen sees “live-stream” closure:
    - Status timeline updated.
    - Before/after photos visible.
    - Citizen can rate resolution; Impact Points awarded.

Tech Stack

🚀 Feature	🎯 Purpose	🧰 Suggested Library / Tool	💡 Why This
UI (Web)	Build admin + contractor dashboard	React	Fast, component-based
UI (Mobile)	Citizen app	React Native + Expo Go	No Android Studio needed
Styling	UI design	Tailwind CSS	Super fast UI building
Backend Framework	API handling	Express.js	Lightweight, hackathon-friendly
Database (Primary)	Store complaints/jobs/users	MongoDB	Flexible schema
Realtime + Auth	Live updates + login	Firebase	Saves tons of backend work
Image Upload	Store complaint photos	Firebase Storage OR Cloudinary	Easy + fast CDN
Maps + Location	Show issue pins	Mapbox OR Google Maps Platform	Clean UI + geo features
Geolocation	Get user location	Browser API / React Native Location	Built-in, no need heavy libs
AI Image Detection	Detect and describe civic issue	Gemini	No model training
Speech to Text	Voice complaint input	Google Speech-to-Text	Multilingual support

Text Processing (NLP)	Auto description + severity	Gemini API	Fast + accurate
API Calls	Frontend → backend	Axios	Simple requests
State Management	Manage app state	React Context API / Redux Toolkit	Keep it simple
Forms Handling	Complaint submission	React Hook Form	Lightweight
Authentication	Login/signup	Firebase Auth / JWT	Easy + secure
Notifications	Status updates	Firebase Cloud Messaging (FCM)	Real-time push
Realtime Updates	Live status tracking	Firebase Realtime DB OR Socket.IO	Instant UI updates
File Handling (Backend)	Upload images	Multer	Works with Express
Environment Config	Manage keys	dotenv	Keeps secrets safe
Logging	Debugging	Morgan	Easy logs
Deployment (Frontend)	Host web app	Vercel	1-click deploy
Deployment (Backend)	Host APIs	Render / Railway	Simple setup
Database Hosting	Cloud DB	MongoDB Atlas	Free tier
Version Control	Code collaboration	GitHub	Essential
